YUVIPEP 360° INNOVATION ECOSYSTEM

Building India's first School-to-Startup Innovation Pipeline

The **YuviPep 360° Innovation Ecosystem** is a full-stack platform embedded directly within academic environments. It creates a structured pathway in which students move from foundational innovation learning to advanced technology application, industry immersion, prototype development, incubation, and investor readiness.

YuviPep 360° is an integrated framework that strengthens learning environments, builds student capabilities and creates a clear pathway from learning to leadership. The ecosystem is designed to complement the evolving CBSE skill education structure, including **Kaushal Bodh and Kaushal Vikas**, while extending opportunities for students to explore technology, innovation and applied learning across the wider school journey.

Aligned with

National Education Policy 2020

Independent Skill Development Mission

Accredited

STEM.ORG ACCREDITED EDUCATIONAL EXPERIENCE

Core Values

Credibility | Compliance | Industry Focused | Global Relevance

YuviPep Partnership Advantage

300+ institutions, 100+ organisations and growing

The Two Offerings

The school partnership brings together two complementary offerings that work as one ecosystem. The YuviPep 360° Programme builds capability progressively from Grades 1–12, while the Composite Skill Lab provides the tools, technologies and workspace where students can experiment, create and build. Together, they create a visible, hands-on innovation environment within the school.

Offering	Description
YuviPep 360° Programme	A school-wide innovation and future-skills programme for Grades 1–10, integrating Practical Science, Design Thinking, Coding, Mechatronics, Automation, IoT, AI and Robotics through a progressive learning journey.
Composite Skill Lab	A multi-disciplinary, hands-on lab bringing together Electronics, IoT and AI, Digital Fabrication, Agriculture and

Copyright 2026 YuviPep© All Rights Reserved

	Life Systems, Tools and Mechanical Skills, Healthcare and Wellness, Retail and Enterprise, Media and Communication, and Safety.

The result is a school environment in which innovation becomes part of the student journey, not a one-time activity. Students learn, experiment, build, improve and present, while the school develops a sustained platform for technology, creativity and student achievement.

YuviPep 360° Programme

The YuviPep 360° Programme creates a continuous progression of skills across Grades 1–12. Younger students begin with observation, experimentation, materials, movement, circuits and simple problem-solving. As they advance, they work with coding, sensors, motors, systems, data, automation, AI and robotics, gradually taking on more complex projects and complete system planning. The learning grows with the student.

Core Learning Areas

Copyright 2026 YuviPep© All Rights Reserved

The YuviPep 360° Advantage

Learning is extended beyond the classroom through projects, innovation events, competitions, mentorship and real-world exposure. Students are encouraged to take an idea from concept to creation: identify a challenge, explore possibilities, develop a solution, build a prototype, refine it and communicate the result. This gives students a meaningful reason to apply the skills they learn.

Built on ten strategic pillars, the YuviPep 360° Advantage creates a powerful ecosystem that connects learning with industry, innovation and global opportunity.

Gateway to Global Opportunities

CXO Academics Beyond Classroom
THE EARLY CXO EXPERIENCE

- International immersion program delivering industry, innovation, and academic exposure
- Builds global perspective and early career readiness.

YuviPeP®
MAGAZINE

- Innovation stories, simplified science, career pathways, financial literacy, and sports.
- Content focused on what students need in the age of algorithm bias.

Mentorship, Recognition and Appreciation

Appreciation from National Leadership

Jyotiraditya M. Scindia, Union Minister of Communications, appreciated YuviPep student innovation, creativity and problem-solving through the Innovation Base Course (IBC).

Expert Guidance from ISRO Veterans

Former ISRO leaders, including Padma Shri awardee Mr V. Gnana Gandhi, Mr R. S. Bhatia, Mr Sreenivasa Prasad K and Mr M. S. Srinivasan, bring mission-level expertise and real-world evaluation, helping students strengthen ideas through clarity, disciplined planning and responsible innovation.

YuviPep's Knowledge Portals

AI / ML Bootcamp

Hands-on immersion in Artificial Intelligence and Machine Learning, where students build, test and deploy real-world solutions using industry-relevant tools.

Corporate Internships

Live industry exposure that transforms academic learning into workplace experience, building professional skills and real-world confidence.

Mentorship & Global Competitions

Structured guidance for national and international competitions, from idea refinement to prototype development and high-impact presentations.

Investment Rounds & Start up Showcases

A platform for students to present working prototypes to real investors, building pitching skills, business acumen and fund readiness for today and tomorrow

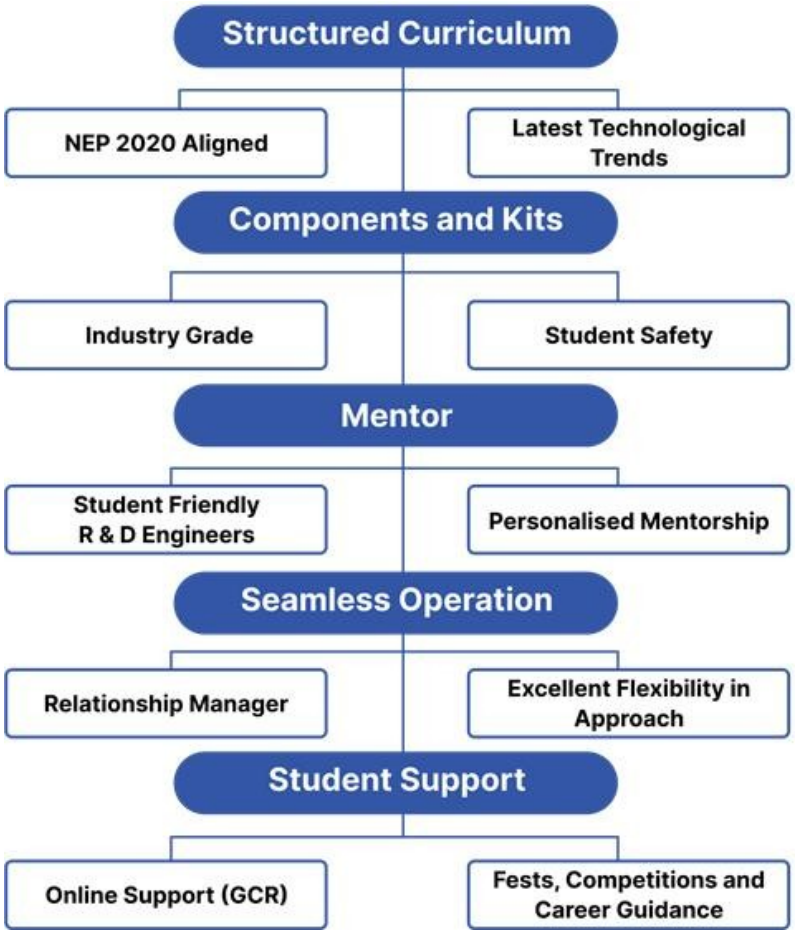

Next Gen Founders (NGF)

Next-Gen Founders (NGF) is YuviPep's flagship student innovation platform, designed to nurture responsible innovators and future-ready entrepreneurs.

The programme enables participants to ideate, prototype, and pitch real-world solutions, supported by structured mentorship, industry exposure, and CXO-led evaluation.

Grade-Wise Learning Journey - IBC

The IBC learning journey is designed to progress across grades, with students building on their skills and concepts as they move from one level to the next. The overview below provides a high-level glimpse of the learning journey. A detailed syllabus, including specific projects, activities and learning outcomes, can be provided upon request.

Grade 1 — Explore simple parts and notice what happens

1 Lights and sounds	A battery gives energy, and pressing or switching can start or stop an action.
2 Things that move	Energy can make things move, and different hand actions create different movements.
3 Testing materials	Materials can be grouped using what they observe: glow or no glow.
4 Building with shapes	Careful step-by-step building improves balance, hand control and shape awareness.
5 Safe working and explaining	Safe habits, observation, confidence and simple cause-and-effect explanation.

Grade 2 — Build again, compare results and work with less help

1 Ways to control light and sound	Different controls can start, stop or change the same result.
2 Gears and moving parts	Turning one part can transfer movement and may change speed or direction.
3 Parts that react	A change in the surroundings can start an action without someone continuously pressing a button.
4 Movement creating an effect	Well-joined parts give a steadier result, and movement can create another visible effect.
5 Checking their own work	Simple checking and correction instead of immediately asking an adult to rebuild it.

Copyright 2026 YuviPep© All Rights Reserved

Grade 3 — Understand what starts an action and begin coding

1	Inputs and outputs	A button or sensing part can be an input; light, sound or movement can be an output.
2	Making 3D shapes and strong structures	Shapes, balance and support choices affect whether a structure is strong and steady.
3	First coding activities	Instructions must be placed in the correct order; repeat blocks save time.
4	Energy from hand, wind or water	Natural or hand movement can produce a useful output, and a reading helps compare results.
5	Finding a missed step	Problems can be solved by checking in order rather than changing everything at once.

Grade 4 — Test choices, use coding decisions and improve a build

1	Comparing lights and controls	The choice and arrangement of parts can change how well a model performs.
2	Responding to movement, moisture or nearby objects	Sensing parts can notice a condition and give a useful warning or response.
3	Gears, slopes, cranks and cams	Size, position and simple ratios can change speed, force or type of movement.
4	Interactive coding	A program can make different choices depending on what happens.
5	Testing and improving	Testing helps decide whether a change made the build work better.

Copyright 2026 YuviPep© All Rights Reserved

Grade 5 — Write simple code and test under real conditions

1	Choosing and checking components	Component choice affects performance, and readings provide better evidence than appearance alone.
2	First text-based coding	Written instructions can control a physical output and respond to a button.
3	Light and adjustable controls	A changing input can create a changing output rather than only a fixed result.
4	Changing motor direction and speed	Motors need suitable control parts, and direction or speed can be changed for a practical purpose.
5	Planned testing	A fair test changes one condition, records the outcome and checks whether the response is reliable.

Grade 6 — Combine several parts and explain a complete working system

1	Colour, magnet and stronger-output controls	Different control parts are chosen for different jobs, especially when a small control must operate a stronger output.
2	Reusable code and exact movement	Reusable code makes instructions clearer, and changing a value can change movement precisely.
3	Using more than one sensing part	Several inputs can work together to produce a more useful response or displayed message.
4	Designing on a computer	Digital design choices affect size, fit, strength and movement in a physical model.
5	Finding errors and viewing data	A system becomes more reliable through step-by-step checking, and readings can be shared for remote viewing.

Copyright 2026 YuviPep© All Rights Reserved

Grade 7 — Build safely, take readings and check that systems work

1	Building electronic circuits safely	How common electronic parts are connected safely and what job each part performs.
2	Creating warning lights and sounds	Alerts help users notice a condition and decide what action to take.
3	Monitoring changing conditions	Sensors turn changes in the surroundings into readings or visible responses.
4	Using a multimeter	Measurements help confirm whether power and components are working correctly.
5	Controlling movement	Movement can be controlled for a useful and safe purpose.
6	Automatic response to light	A system can respond to its surroundings without repeated manual switching.
7	Checking and presenting	Good testing checks one section at a time and clearly explains input and output.

Grade 8 — Combine parts, find faults and make systems more reliable

1	Neat and reliable circuit building	Clear placement and secure connections make a system easier to test, repeat and repair.
2	Alerts with several steps	A working alert has a trigger, a decision or control step, and a final response.
3	Choosing when an alert should start	A suitable trigger level reduces false or inconsistent alerts.
4	Showing useful information	Information should be clear enough for a user to decide what to do next.
5	Safe motor movement	Movement must be reliable and include safe operating limits.
6	Finding and fixing faults	A logical checking order finds problems faster than replacing parts randomly.
7	Explaining practical use	A technical build is valuable when it addresses a clear need and its limits are understood.

Copyright 2026 YuviPep© All Rights Reserved

Grade 9 — Build automatic systems and diagnose problems using evidence

1	Automatic responses	An automatic system follows clear rules that link each condition to a response.
2	Finding the root cause of a fault	Evidence can show whether the problem is in power, a connection, a sensor, the code or the output.
3	Motors, pumps and moving mechanisms	Electrical control and mechanical parts must work together to produce useful movement or force.
4	Solar, wind and energy transfer	Energy output changes with conditions and passes through stages before it reaches the final load.
5	Displays and control panels	A clear control panel helps a user understand system status and respond correctly.
6	Smart buildings and public services	Technology can monitor conditions and respond with less manual effort.
7	Technical presentation	Clear technical communication explains what should happen, what was tested and why the result is trusted.

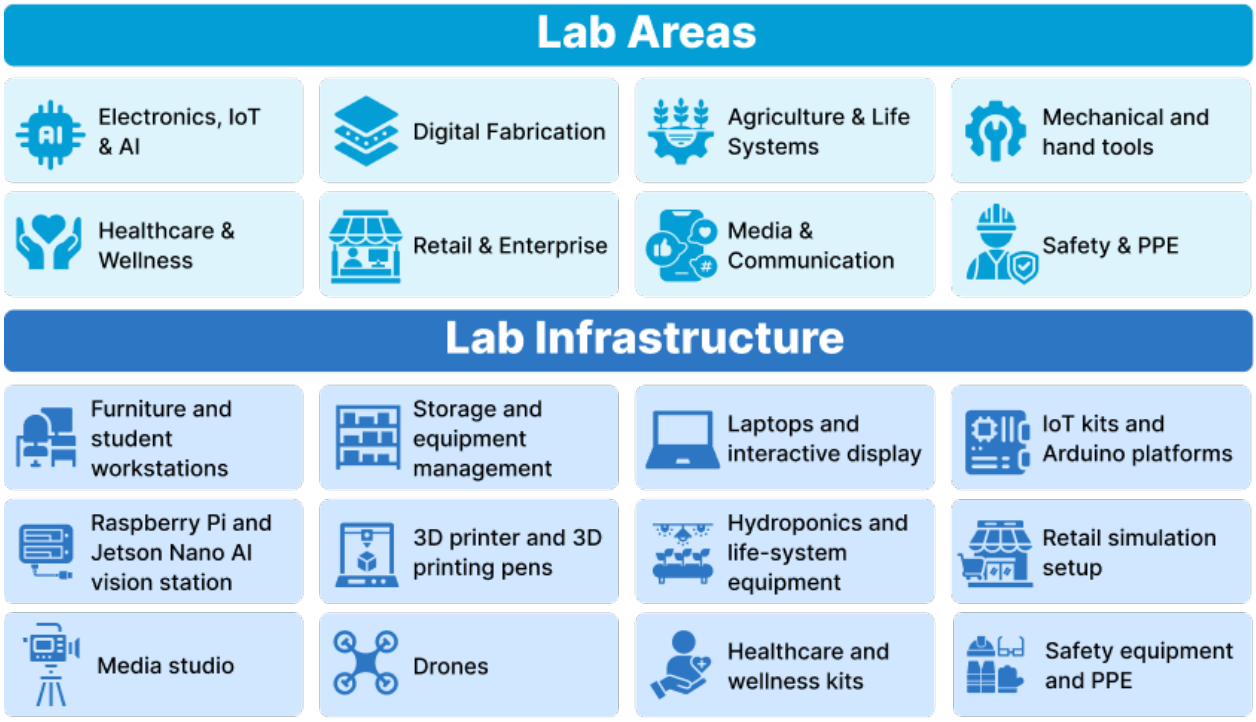

Grade 10 — Plan, test and improve practical technology systems

1	Planning a complete system	A good design begins with clear functions and a measurable definition of success.
2	Handling several conditions	A complete system must handle normal, warning, fault and recovery situations.
3	Testing performance with data	Repeated data shows whether the system meets its requirement and how much results vary.
4	Separating hardware and software problems	Hardware, software and mechanical faults require different checks.
5	Making energy and infrastructure choices	Real designs involve trade-offs; the best choice depends on the need and evidence.
6	Viewing information remotely	Connected monitoring supports remote decisions, but access and responsible use of data must be considered.
7	Suggesting a realistic improvement	A student can say, "The system **achieves**..., and I would improve... because the test data shows..."

Programme Framework - Composite Skill Lab

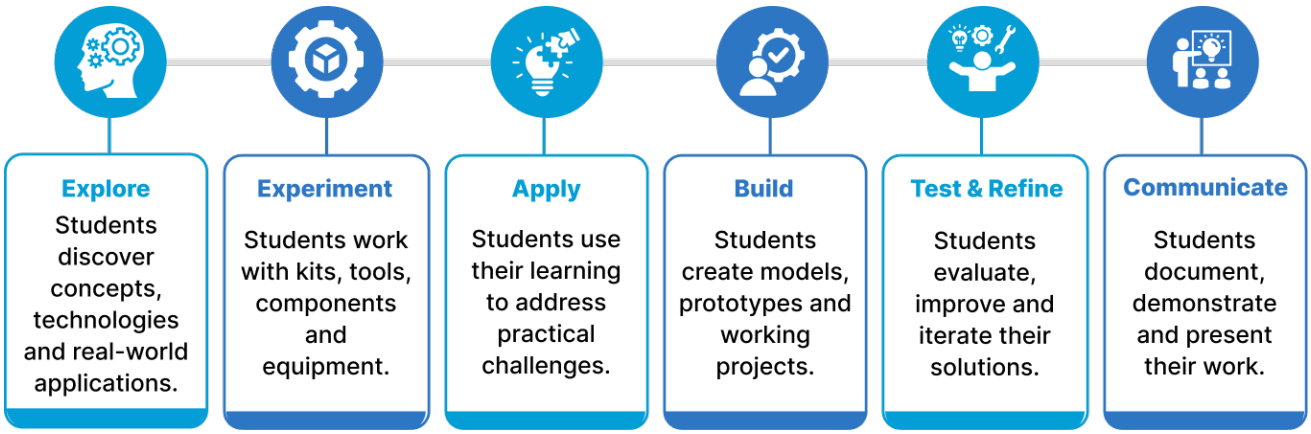

The Composite Skill Lab is the physical engine of the innovation programme. It brings multiple technology and application areas into one practical environment, allowing students to move from an idea or classroom concept to experimentation, prototyping and testing. Instead of only discussing how technology works, students get the opportunity to work with it.

How the Two Offerings Work Together

Together, the two offerings create a complete innovation pathway. The programme develops the student's knowledge and capability. The lab provides the environment in which that capability becomes visible through practical work. The student journey therefore moves naturally from learning a concept to applying it, building something, testing it, improving it and presenting it.

Composite Skill Lab Infrastructure

The proposed Composite Skill Lab includes the following infrastructure, equipment and tools.

Furniture and Workstations	Quantity
Durable 5 x 4 ft Modular Group Worktable	5
Robust Stackable Student Stool	40
Lockable Teacher Worktable	1
Ergonomic Teacher Chair	1

Storage and Organisation	Quantity
Lockable Tool, Kit and Consumables Cabinet	2
Heavy Duty Open Storage Shelf	2
Labelled Small Parts Storage Set	15
Wall Mounted Tool Pegboard with Hooks	2

Digital Fabrication	Quantity
Standard FDM 3D Printer for CAD Prototypes	1
Handheld 3D Model-Making Pen	2

Safety and PPE	Quantity
Educational and Safety Lab Wall Chart	1

Lab Infrastructure	Quantity
Computer	1
Large 8 x 4 ft Teaching & Project Whiteboard	1

Electronics, IoT and AI	Quantity
Arduino Circuit, Sensor & Coding Group Kit	10
Expanded Wi-Fi IoT Project Group Kit	8
Expanded Sensor, Motor & Actuator Set	5
Digital Circuit-Testing Multimeter	8
High-Accuracy Digital Multimeter	2
Precision Temperature-Controlled Soldering Station	1
Supervised Electronics Soldering Kit	5
Raspberry Pi Edge AI & Camera-Vision Station	1

Tools, Mechanical and Textiles	Quantity
Shared Hand-Tool Project Station	2
Power & Hand-Tool Fabrication Station	1
Corded Drill Station with Bit Set	1
Basic Stitching & Textile Project Machine	1
Motorised Textile Project Machine	1

Healthcare and Wellness	Quantity
BP, Oxygen, Temperature and First Aid Practice Kit	1
Contact-Free Temperature Screening Device	1
Feedback-Enabled CPR and AED Emergency Training System	1

Media and Communication	Quantity
Digital Content-Creation Kit with Demonstrations & Presentations	1

Retail and Enterprise	Quantity
Barcode, RFID & Retail Billing	1

Agriculture and Life Systems	Quantity
Gardening and Cultivation Group Kit	5
Basic Soil-Free DWC Hydroponics Station	1
Digital pH & Nutrient-Strength Meter Set	1

Copyright 2026 YuviPep© All Rights Reserved

Programme Structure and Investment

Programme Deliverables

Deliverable	Provision
R&D Engineer	Yes
GEN-i Internship	Yes
Study Materials and Workbooks	Yes
Kits and Components for Experiments	Yes
Innovation Fest	Eligible
Timely Assessments with Revisions	Yes
Project Assistance	Yes
IBC Certificates	Yes
Parent Orientation Support	Yes
Exclusive Account Manager	Yes

Investment Framework

Parameter	Details
Annual Price Per Student	**₹2,500 net**
Programme Duration	10 months
Workshop Frequency	Once a week
Number of Students	700
Grades	6 to 10
Note: All required Innovation materials and kits will be securely stored in a designated classroom to ensure smooth and organised programme execution.	

Innovation Framework – Composite Skill Lab

Parameter	Details
Lab Type	Composite Skill Lab
Lab Positioning	Core Composite Skill Lab
Space	400 to 800 sq ft
Core Forms of Work	Electronics, IoT and AI
CBSE Skill Modules	Covers 11 skills
Total Investment including GST	**₹10,63,758**

Copyright 2026 YuviPep© All Rights Reserved

Copyright 2026 YuviPep© All Rights Reserved

Composite Skill Lab – School Requirements

To ensure smooth installation and operation of the Composite Skill Lab, the school will provide the required infrastructure and room readiness.

Parameters	Description
Room	A lab room meeting the dimensions specified for the chosen package must be made available before installation.
Internet	Stable Wi Fi or LAN connectivity for IoT, AI and content creation stations.
Painting	Wall and ceiling painting of the lab room before installation.
Electrical	Power points, wiring, lighting and earthing for lab equipment.
Plumbing	Water supply and drainage for the hydroponics or wash area.
Lab Readiness	General civil readiness including workbench base points and exhaust or ventilation as required.
IT Support	A local IT support or network administrator point of contact for setup and maintenance.
Interior	Flooring, false ceiling if any and general room finishing.
