Innodhara

Automating Sales Process

A field representative records a conversation. From that alone the system builds the project, the dated plan, the staffed tasks and every message that goes back to the client — and stops at every point where judgement is required, to hand the decision to a named person.

Setup checklist · role-by-role feature guide · what the system refuses to do

What this manual is

This is the manual for the people who will use **Innodhara** every day, and for whoever sets it up before they do. It has two halves.

Part	What it covers	Who needs it
1	How the product thinks — the five ideas everything rests on	Everyone, once
2	The six roles, and what each person sees when they sign in	Whoever assigns accounts
3	**The go-live checklist** — what must be in the system before your first client	The administrator
4	The feature guide — every screen, and what each button does	Every user
5	What the system refuses to do, and why that is the point	Anyone evaluating trust
6	The daily and weekly rhythm	Team leads
7	When something looks wrong	Everyone

> **HOW IT WORKS**
>
> The product is **domain-neutral**. Nothing in the engines, the prompts or the database assumes an industry — you describe what you sell once, in Part 3, and the same machinery runs for training, infrastructure, consulting or logistics. The words the system uses with your clients come from *your* templates and *your* rate card.

How the product thinks

1

Five ideas. Everything else in this manual is a consequence of one of them, so it is worth five minutes now.

1 · The client is the relationship. The project is the work.

A client record holds the relationship — who they are, who works there, every note and every conversation. A **project** is one concrete piece of work for them. One client can have many projects, and each project carries its own plan, its own team and its own money.

2 · Every project has one living plan, and it is versioned

The plan is never edited in place. When something changes — a new meeting, a client reply, a slipped date — the system writes a **new version** with a plain-language summary of what changed, and the old version stays readable forever. A new version changes nothing until somebody approves it: while it waits, the live plan is untouched.

3 · The AI proposes. A person decides.

The system drafts, schedules, chases and remembers. It stops at every point where judgement is required. **No message ever reaches your client without somebody tapping Approve**, and every AI decision is recorded with its reasoning, so "why did it do that?" always has an answer.

4 · Work is matched to people by recorded skill

Each person has skills on their record. When the plan needs a task done, the system builds a candidate list from those skills, weighs current workload, leave and travel, and picks — then writes down *why*, in a sentence the assignee can read. This is why Part 3 treats skills as non-optional.

5 · Nothing is destroyed

Plans supersede, they do not overwrite. Tasks move to done, cancelled or superseded. Proposals accumulate revisions. Every state change writes a history row. You can always reconstruct what was true on any past day.

1. Record or type a conversation
2. AI extracts the work
3. A human confirms it
4. Plan version created
5. Tasks staffed by skill
6. Client emails drafted

The six roles

A person's role decides their navigation and their permissions. The server enforces it — the screens simply do not offer what a role cannot do.

2

Assign roles deliberately: the bottom bar of the app is **assembled from the role at sign-in**, so the same build looks different for each person. Below is exactly what each role gets.

Sales agent

The field representative

Bottom bar: Home · Leads · Jarvis · Tasks · **Inbox**

The only role with the Inbox tab: logs client replies that arrived by phone or WhatsApp, works the triage queue, and reads the delivery trace of anything sent.

Sales lead

Owns the pipeline and signs off

Bottom bar: Home · **Pipeline** · Jarvis · **Approvals** · Team

Pipeline holds two sub-tabs — Leads and Projects — so this role does everything from creating a client to reading any project. Books demos; approves outgoing messages.

Operations agent

Delivers the work

Bottom bar: Home · **Tasks** · Jarvis · Projects · More

Lives in Tasks: progress, decline, block, re-date, split, record a vendor promise, and finish work — which is what triggers the client update.

Operations lead

Owns delivery

Bottom bar: Home · **Delivery** · Jarvis · Incidents · Team

Confirms the assignment batch before anyone is notified, watches project health, and — with the administrator — is the only side that can reschedule or close a demo.

Organisation admin

Sets the product up

Bottom bar: Home · **Approvals** · Jarvis · Admin · Insights

Sees every approval in the organisation. Owns everything in Part 3: staff, skills, what you sell, pricing, templates, approval rules and the behaviour dials.

Platform operator

Runs the platform, not your business

Bottom bar: Separate console

Creates organisations and reads aggregate counts only. This role is blocked from reading any client's sales data — by the server, not by a screen.

Where things live, per role

	Sales agent	Sales lead	Ops agent	Ops lead
Clients	Leads tab	Pipeline → Leads	—	—
Projects	Client → Projects	Pipeline → Projects	Projects tab	Delivery tab
My work	Tasks tab	Home cards	Tasks tab	Home cards
Approvals	—	Approvals tab	—	Home cards
Client replies	**Inbox tab**	Home card, when one is waiting	—	Home card
Demos & follow-ups	Home cards	Home cards	Home cards	Home cards

Pipeline opens on the Projects sub-tab — tap **Leads** first when you want a client list.

THE SYSTEM WILL REFUSE

Two refusals you should expect, because they are correct. A **sales lead can book a demo but cannot reschedule one** — moving a booked visit belongs to operations. And a person can only act on **their own** tasks: blocking or re-dating someone else's is refused, though anyone may report that work is finished, because covering for a colleague is legitimate teamwork.

The go-live checklist

3

Work down this list before your first real client. The right-hand column is what actually happens if an item is skipped — these are the product's own refusal messages, not warnings invented here.

Essential — the product cannot work without these

	Set this up	Why it matters	If you skip it
☐	**Organisation and its first administrator**	Creates the tenant every other record belongs to, and the one account that can configure it. Done once by the platform operator.	There is nothing to sign in to.
☐	**Staff accounts, with the right role**	Email is the identity and decides the organisation; the role decides the navigation and the permissions. Set each person's department too — it decides who receives their escalations.	People either cannot sign in, or see the wrong app.
☐	**A skill on every person's record**	This is the single highest-value entry in this list. Tasks are matched to people by skill, weighed against workload and leave. Give everyone the neutral skill **general** plus their real specialisms, at basic, good or expert.	Every task falls to the phase lead flagged "no skill match", at low confidence, and is routed to a human instead of being assigned.
☐	**What you sell — one entry per offering**	Named and described. The description is what the AI reads when it decides which of your offerings a conversation was about.	Conversations cannot be matched to an offering, and no proposal can be built.
☐	**A rate card for each offering**	Every line: code, label, unit ("per rack", "per seat", "per site"), unit price, and a default quantity where one is sensible. Rate cards are versioned — editing prices creates a new version and never alters a proposal already sent.	"No pricing table for this offering. Ask your administrator to add one." No proposal can be created.
☐	**A proposal template for each offering**	Your document, with placeholders the system fills in — client name, contact, the rate table, the total, and a one-line summary of the engagement.	"No proposal template for this offering. Ask your administrator to add one."
☐	**Message templates: introduction and follow-up**	One of each, for email and for WhatsApp. These are the words a new contact first reads, so they should sound like your organisation.	The introduction that a scanned business card is supposed to draft cannot be produced at all.

Strongly recommended — the product works, but less well

	Set this up	Why it matters	If you skip it
☐	**Approval rules**	Who signs off what, as data: a condition (for example a discount above 10%, or an amount above a threshold), a rank, an approver role, an optional second approver and an optional recommender. Changing who approves what is a settings edit, never a software change.	Everything falls to one default approver, and nothing is escalated by value or risk.

	Set this up	Why it matters	If you skip it
☐	**Standard task waves for each offering and phase**	Your repeatable checklist — what always happens in preparation, in delivery, at payment, at closure — with day offsets from the start date.	Each phase is derived from scratch by the AI instead of following your known-good routine.
☐	**The behaviour dials**	Working days and hours, quiet hours, the three nudge intervals, how many messages one client contact may receive per week, the payment-reminder schedule, when the weekly report goes out, and whether task assignments apply automatically or wait for a lead.	Sensible defaults apply, but the system will chase on days you do not work and at hours you do not keep.
☐	**Email sending**	Either an organisation-wide sending account, or — better — each salesperson's own, so the client always sees a real person's address.	Messages are drafted, approved and written to an outbox file instead of being delivered.
☐	**Retention windows**	How long recordings and transcripts are kept before they are automatically deleted and scrubbed.	Defaults apply: recordings 90 days, transcripts one year.

Optional — turn on when you need them

	Set this up	Why it matters	If you skip it
☐	**Demo teams**	Named squads with a team lead, a media representative and a sales representative, so a booking can be made against a team and clashes detected.	Demos are still bookable; they simply carry no team.
☐	**Calendar**	Connect a calendar and confirmed demos are mirrored into it. The system's own calendar remains the source of truth either way.	Invitations still reach clients by email; nothing appears in your own calendar.
☐	**Vendors**	Outside suppliers your plans depend on, so a vendor promise can be recorded against a task and chased.	Vendor promises can still be typed as free text, but are not tracked as vendors.
☐	**Suppliers of inbound mail**	Connect a mailbox and client replies are read and classified automatically.	Replies are captured by hand with **Log a reply**, which works fully and takes seconds.

BEFORE YOU GO LIVE

Two things to verify on the day, before anyone demonstrates anything. First, that sending is switched on if you intend real email to leave — otherwise approved messages are written to a file and everyone believes they were sent. Second, that at least one person holds each skill your rate card implies; the quickest check is to open any project after the first meeting and confirm every task shows a named person rather than the phase lead.

The feature guide

Screen by screen, in the order the work happens. Everything below is reachable by tapping — nothing here requires a keyboard shortcut, a browser or an administrator.

4

4.1 Signing in, and pointing the app at your server

To do this	Tap this
Sign in	Email and password. Your role decides the tabs you get.
Change your password	Forced on first sign-in; available afterwards from your profile.
Point the app at a different server	On the sign-in screen, tap the **server:** chip — or long-press the logo — paste the address and **Apply**. It is stored on the device and survives restarts.
Work with no signal	A banner appears. Approvals you have already loaded stay readable, and decisions you make are queued and applied — exactly once — when the connection returns.

4.2 Home — what needs you today

Home is a single answer to "what should I do now?". It opens with a briefing written for you, then a stack of cards for anything waiting.

To do this	Tap this
Read your briefing	Top of Home: work due today, genuinely late work, approvals waiting, replies that arrived overnight, follow-ups due and demos ahead.
See what is waiting on you	Cards below the briefing — approvals, a meeting needing review, an assignment batch to confirm, inbound messages needing a human.
Refresh	Pull down anywhere on Home.
Open your notifications	Tap the **bell**. Every notification opens the exact record it is about.
Jump to a demo or a follow-up	The **My day** cards — Demos and Follow-ups — open their full screens.

4.3 Clients

To do this	Tap this
Create a client	Leads (or Pipeline → Leads) → **+** → name → Save.
Open the six tabs	Overview · Contacts · Projects · Notebook · History · Meetings. **The action buttons change with the tab.**
Add a contact by hand	Contacts → **Add contact**. Mark the main person **Primary**.

To do this	Tap this
Scan a business card	Contacts → **Scan card** → Capture. The reading appears with a confidence score — **correct anything wrong, then Save**. Only what you save counts, and the introduction email is drafted from the saved version.
Record something worth remembering	Notebook → **Add note**. Notes feed the AI's memory of this client.
Move the client through its stages	Overview → **Change state**. When the AI suggests a move it appears as a banner with the reason, and **Keep as is** beside it.
See what has happened	History for the state trail, Meetings for every conversation.

4.4 Meetings — the way work enters the system

To do this	Tap this
Record a conversation	Client → Meetings → **Record meeting**. A consent sheet comes first: record how the client agreed. It will not record until you do.
Watch it being processed	The meeting screen shows the stages as they happen — uploaded, transcribing, extracting, ready for review.
Retry a failed recording	**Retry** on the meeting screen. It tells you what went wrong, and reuses the transcript rather than transcribing again.
Type or dictate notes instead	Client → Meetings → **Type notes**. Typed notes go through exactly the same brain as a recording — useful when recording was declined.
Confirm what the AI heard	Home card, or the meeting screen. **Edit** a title, **drop** anything wrong, **add** what it missed, then **Confirm**. If two items look alike it says so, so you can drop the repeat. **Nothing becomes work until you confirm.**

4.5 Projects

To do this	Tap this
See everything about a project	Eight tabs: **Overview** (objective, status, health *and the reason*) · **Plan** · **Tasks** · **Timeline** · **People** (client side) · **Team** (your side) · **Conflicts** · **Reports**.
Understand why someone got a task	Tasks → open one → **Assigned because** — the recorded reason, including any caveat such as a tie between equally suited people.
See the promises in play	Overview → **We owe them** and **They owe us**. Every promise made aloud is tracked and chased.
Add a client-side person	People → **Add stakeholder**, with their role in *their* organisation and whether they receive progress updates.
Change who is on the team	Team → **Add member**. Removing someone asks first, then redistributes their open work.
Get a briefing on a project you have not touched	**Catch me up** at the top of the project.
Produce the weekly report	Reports → **Generate this week's client report** — it is queued for approval, never sent automatically. The internal digest is not gated.

To do this	Tap this
Move the project on	**Change status**, or **Shift phase** to generate the next wave of work.
Split one deal into branches	**Split into branches** — commercials stay on the parent, delivery moves to a child project per site.
Resolve a contradiction	Conflicts → open → **Resolve** with a note. The plan version that was held is then released for approval.

4.6 Jarvis — the assistant

Jarvis is the fastest route to almost everything, and the only route to a few things. Type or speak; short and loose is fine — working out what you meant is the assistant's job, and when it genuinely cannot it asks one question rather than guessing.

To do this	Tap this
Ask about a client	"tell me everything about *client*", "what did they say about the handover pack"
Ask about a project	"give me a brief about the *x* project" — objective, health and why, plan version, task counts, the client's people, open promises, what is due next
Ask what is stuck	"what's blocking *x*" — includes decisions waiting and contradictions, not just late work
Ask about your own work	"what is late", "most important task this week", "how many approvals are waiting on me"
Ask why the AI did something	"why did you pick *name*" — quotes the recorded reason verbatim, caveats included
Create things	"add a note to *client*: …", "create a task to … by Friday", "schedule a follow-up with *name* next Tuesday"
Build and send a proposal	"create the *x* proposal for *client*", then "email the proposal to *name*". **This is the only way to create a proposal.**
Use your voice	Tap the **mic**. Toggle **speak replies** and it reads answers aloud.
Start again	**New conversation** — the assistant genuinely forgets the previous thread rather than hiding it.

> **GOOD PRACTICE**
>
> Relative dates work: "last Tuesday", "next Monday", "by month end". The assistant is told today's date, so you never have to type one.

4.7 Proposals

To do this	Tap this
Create one	Ask Jarvis (see 4.6). It is built from your template and the current rate card.
Read it	Five sections: Commercials · Total · Narrative · Revision trail · actions. The header names the template and rate-card versions it locked.
Change the wording	**Change it (by instruction)** — for example "make the tone warmer and lead with the handover pack". The narrative changes; **the commercials and the total cannot**.
Change the numbers	Adjust quantities through the assistant, or change the rate card itself. A price the AI was not given cannot appear.
Read the PDF	**View PDF** — it renders in the app.
Submit for internal review	**Submit for internal review**. Your approval rules decide who signs off; below every threshold it clears at once.
Send it	Ask the assistant to email it, then **Approve & send**. It goes from the salesperson's own address with the document attached.
Replace it with a file you edited outside	**Upload edited file**. The locked total must still appear in the document or the upload is refused, and the proposal returns to draft for review.

4.8 Demos and site visits

To do this	Tap this
Book one	Client → Overview → **Book demo** → date, time, notes. A clash is warned about, never hidden. The invitation is drafted and waits in Approvals.
See the month	Home → **Demos** card. Dots mark days with work due; **long-press** a day to see that day's tasks.
Move one	Operations, or an administrator: open the demo → **Reschedule**. An updated invitation is drafted for approval. *A sales lead who booked it cannot move it.*
Close one out	Operations, or an administrator: **Update status** → Completed, or Cancelled, which retracts the invitation.

4.9 Follow-ups

To do this	Tap this
See what is due	Home → **Follow-ups** card. Four buckets: due today, overdue, this week, all pending.
Create one	Ask Jarvis — "schedule a follow-up with *name* next Tuesday, note: …".
Let the AI write the chase	Open one → **Draft message (AI)** with a short prompt. It goes to Approvals, not out the door.
Close one	**Mark done** with a note, leaving **Schedule the next one** ticked — so a relationship never quietly goes cold.

4.10 Inbox — what clients send back

The Inbox is permanently available to the sales agent. Everyone else reaches it from the Home card that appears when something needs a human.

To do this	Tap this
Record a reply that arrived elsewhere	**Log a reply** → choose the person it came from → paste what they said → **Log it**. A phone call, a WhatsApp or a corridor conversation is then treated exactly like an email, and the system tells you how it understood the message.
See exactly what was sent	Messages → open one → **Delivery trace** — the real message and every delivery event in order. Not what we think we sent.
Handle what the AI could not place	**Needs a human** tab. Read the whole message, attach it to a client or a project, correct what it is asking for, draft a reply, or mark it handled.

4.11 Tasks — doing the work

To do this	Tap this
See your work in order	Tasks tab: **Blocked · Overdue · Today · This week · Later**.
Know why it is yours	Open a task → **Assigned because**, and where it applies **Fulfils a client commitment**.
Report progress	**Progress** with a note — it lands on the project timeline.
Say it is not for you	**Decline** with a reason. It is re-routed to someone better suited, and the decline stays on record.
Say you are stuck	**Block** and name the blocker. Nudges to you stop, and the blocker gets chased instead.
Ask for a later date	**New date** with a reason. If it would break a dependent task or a client promise, it is sent to your phase lead to decide rather than silently accepted.
Break it in two	**Split** — two real tasks, the second waiting on the first.
Record an outside promise	**Vendor promise** with the date, and **Vendor slipped** if it moves. Your coordinator is reminded before the date, not after.

To do this	Tap this
Finish it	**Done** with a result note. If the task was client-visible, the update to your client is drafted automatically — and still waits for approval.

4.12 Approvals — the human gate

To do this	Tap this
Read what you are approving	Approvals → open a card. The **full** message, never a truncated preview, plus the AI's own recommendation where the rule asks for one.
Approve	**Approve**. It applies once, even if you tap twice.
Send it back	**Reject** with a note. **The note becomes the instruction** — a redraft comes back having applied it.
Handle an unfinished draft	If blanks remain you are told, and shown the lines they sit on. Choose **Send as it is** or **Not yet** — there is no silent send.
Approve while offline	It queues, and applies exactly once when you reconnect.

What the system refuses to do

5

These are not limitations to work around. Each one exists because the alternative caused a real problem, and each is enforced in code rather than asked of the AI in a prompt.

It will not…	What happens instead
Send anything to a client without a human tap	Every outgoing message is created in a pending state and waits for Approve.
Send a draft with blanks left in it	The approval is refused, the offending lines are quoted back, and you may approve again deliberately.
Invent a price, a discount or a total	Numbers come only from your rate card or a recorded human approval. A rewrite that slips a new figure into the words is rejected outright.
Process a recording without consent captured first	The upload is refused. Consent must already have been recorded, and the system links that record rather than writing its own.
Pick a side when two people contradict each other	It writes down both positions, names who said what, and holds the re-plan until a person resolves it.
Guess when it is unsure	Below a confidence threshold you control, it routes the decision to a named person with the reason.
Answer a client question it has no data for	It creates a task for a named person instead of composing something plausible.
Apply an out-of-date plan	Approving a stale version is refused, because it would discard everything a newer version added.
Let one person act on another's task	Blocking, re-dating and splitting are owner-only; leads act across the team.
Write to an address a person has not verified	A contact flagged for review is never messaged.
Contact someone who asked not to be	An absolute stop, honoured even when the draft has no project context.
Chase outside your working hours	Reminders respect your working days, your hours and anyone's leave, and are cancelled the moment the underlying work completes.
Overwhelm one client contact	A weekly cap per person, which you set, defers rather than floods.
Stop silently	Every refusal writes a record with the reason and the remedy. Refusing is allowed; refusing invisibly is not.

HOW IT WORKS

Every decision is explainable. Four independent trails are kept: who did what, what happened in the business, what the AI decided and why it was confident, and what every AI call cost. Ask the assistant “why did you…” about any record, or tap the **Why?** chip wherever it appears.

The rhythm

6

What the product does on its own, and what it will ask of you.

Every day, without being asked

- A personal briefing is prepared for each person before the working day.
- Overdue work is nudged on a three-step ladder — a gentle reminder, then a firmer one, then the lead, who is offered a specific alternative person.
- Promises are checked in both directions: yours are warned about the day before they break, and the client's are chased politely after.
- Silent conversations are followed up, switching channel on the second attempt, and after your limit a person is asked to make a call instead.
- Unpaid invoices are chased on the schedule you set, copying whoever you nominated.
- Anyone carrying more than their capacity is flagged to their lead with concrete moves to make.
- Dormant clients wake up on the date you promised to return, with the story replayed.

Every week

- A client-facing progress report is drafted for each active project on the day you choose — and waits for approval.
- An internal digest is produced for your own team, which needs no approval.

What it will ask you for

- Confirm what a meeting agreed, before it becomes work.
- Confirm the assignment batch, if you have chosen lead confirmation.
- Approve anything going to a client.
- Resolve a contradiction, when two sources disagree.
- Decide, when confidence is low or a date change would break a promise.

When something looks wrong

7

The most common causes, in the order they are worth checking.

What you see	What it usually means
“Can't reach the server”, or network trouble	The app is pointed at an address that is no longer live. Re-check the **server:** chip on the sign-in screen before suspecting anything else.
“Your role can't do this”	Working as designed. The message names the role; ask someone whose job it is, or have an administrator change the role.
Every task is assigned to the same lead, marked “no skill match”	No skills are recorded. This is the first item in Part 3 and the single most common setup omission.
A proposal cannot be created	The offering has no rate card or no proposal template. Both are in Part 3.
A business card scan drafts nothing	No introduction template exists for that channel, or the contact has no address of that kind.
Approved messages never arrive	Sending is not switched on, so messages are being written to a file. Check with your administrator.
A recording will not start	Consent has not been recorded for that client yet.
A recording stalls	**Retry** on the meeting screen. It states the reason and reuses the transcript.
The follow-up list is empty	That is usually correct: a concrete conversation produces a project, not follow-ups. Create one through the assistant.
A plan change has not taken effect	It is waiting for approval. Held changes apply on activation, not when they are proposed.
A notification does not open anything	Tell your administrator which kind it was — every notification is expected to open the record it concerns.

Innodhara · Automating Sales Process

Set the product up once, in Part 3. After that the working day is: read your briefing, record your conversations, and approve what the machine prepared for you.
